Mountz Torque: Cam-Over Technology

The FGC is next-generation cam-over wrench by Mountz Torque. When under- or over-torquing puts your products at risk, the FGC wrench delivers the accuracy you need. Safeguarding against fastening failures, the poka-yoke torque wrench prevents over-torque. Implementing this error-proofing wrench removes the operator's influence out of the torque equation and delivers an accurate and repeatable fastening result than a standard click type wrench.

You can give Mountz FGC wrenches to any operator and have the confidence that he/she will deliver the correct torque, time after time. Mountz FGC tools stay in calibration 2X longer than the most stringent industry standard (ISO 6789).

Safety with Clickwrench

A click wrench is not a 100 % process safe and is often susceptible to over-torque results. A click wrench does not physically prevent an operator from applying additional force, he/she can unknowingly generate over-torque.

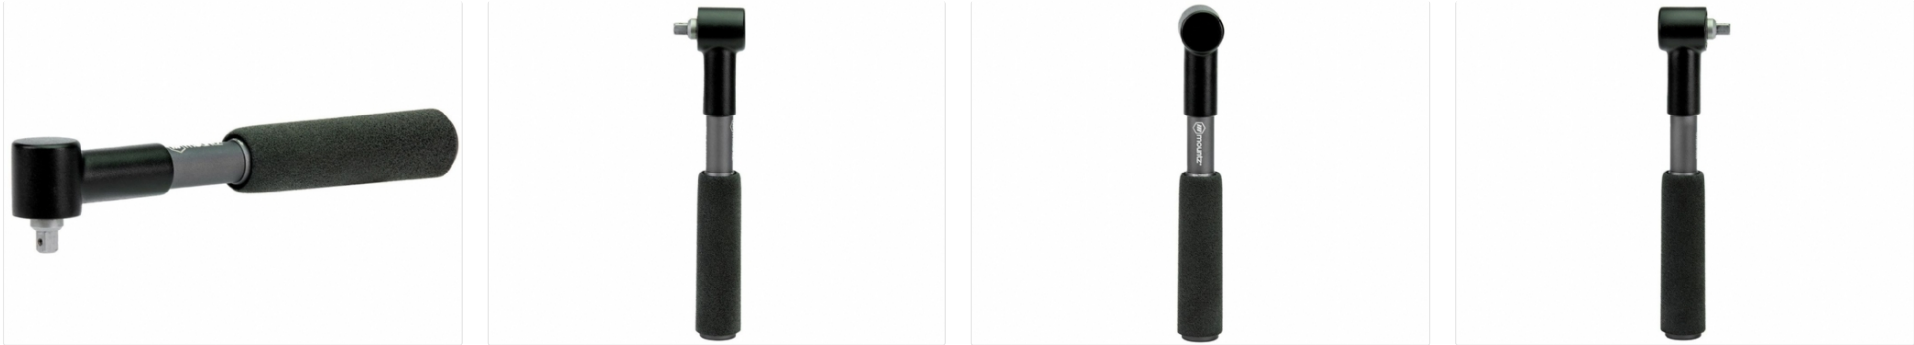

General Features of Mountz FGC Torque Wrench

- Cam-over technology ensures correct torque is applied and eliminates fastener breakage issues
- Poka-yoke torque wrench prevents over-torque, as a click wrench cannot
- Error-proofing assembly process
- Safeguards against fastening failures
- Calibration life 2x ISO standards, unmatched by any wrench
- A preset wrench ideal for fastening applications where operators repeatedly assemble parts at the same torque setting
- A preset production torque wrench
- Tool is set to a designated torque value and the correct torque value is consistently applied
- Tamper-proof internal adjustment. No external adjustment scale - must be preset using a torque analyzer
- Non-length dependent
