3. CALIBRATION PROCEDURE

3.1 Preparations Before Power-up

- (1) Confirm that the power source line doesn't touch GND before turning on a power source.
- (2) Confirm that the position of the a voltage selector and a regular fuse are being used.
- (3) Connect it in the regular power source line after you confirm that the power switch of the product is off.
- (4) 30 minutes and more warm-up is required under the condition that the unit is covered by case before you adjust it.
The measuring equipment used for the adjustment also need 30 minutes and more warm-up.
- (5) Use the Generator 1 and 2 for the Input A. And, use the terminating resistor of 50 Ω when a standard signal generator is connected.
The terminating resistor of 50 Ω isn't used for Input B.

3.2 Adjusting the Power Unit and Other Units
